

~~Patent Claims~~ What is claimed is:

1. An imaging method for a ~~multislice~~ multi-slice spiral CT scan, ~~in which, comprising:~~
 - 1.1. ~~_____ spirally scanning an object to be examined is scanned spirally,~~ with reference to its absorption behavior; ~~i.e. rotating ray bundle moving in the direction of the axis of rotation, and~~
collecting the measured absorption data using are collected by a detector of planar design;
 - 1.2. ~~_____ projecting the measured absorption data are projected onto a virtual detector and, preferably at the fulcrum of the rotation, and filtered, and~~
filtering the data; and
using measured and filtered data produced by rays that penetrate at least one voxel
 - 1.3. ~~_____ in order to reconstruct the an absorption value of the at least one voxel, use is made of the measured and filtered data that are produced by rays that penetrate this at least one voxel,~~
~~_____ characterized in that wherein~~
 - 1.4. ~~_____ the filtering of the data; used for the reconstruction, in the image of the virtual detector is performed in the direction of the a projection of spiral segments that are imaged thereon, and which are produced by the spiral scanning over a prescribed angular range.~~
2. The method as claimed in ~~patent claim 1, characterized in that wherein~~ the filtering takes place along the intersection line of doubly inclined planes in the virtual detector.
3. The method ~~according to as claimed in one of patent claims 1 to 2,~~ characterized in that claim 1, wherein the prescribed angular range for a spiral segment of length L_s is $\leq \Pi + 2 * \beta_{\max}$, ~~length L_s is $\square - \square + 2 * \square \max$.~~
4. The method as claimed in claim 1, wherein one of patent claims 1 to 2, ~~characterized in that~~ parallel sorting of the rays for the purpose for forming the virtual detector takes place before the filtering.

5. The method as claimed in ~~patent claim 4, characterized in that~~ wherein the prescribed angular range for a spiral segment of length L_s is $\leq 180^\circ$.
 ~~L_s is $\leq 180^\circ$.~~

6. The method as claimed in ~~one of patent claims 1 to 5, characterized in that claim 1, wherein~~ the segment planes formed at least approximately by the spiral segments have a maximum inclination such that rays for the segment plane in the detector are present inside the measuring field at the ends of the spiral segment considered.

7. The method as claimed in claim 1, wherein, for the purpose of 3D back projection a spiral segment I_l of length $L_l = [-\alpha_{\max}, +\alpha_{\max}]$ with $\alpha_{\max} = M \cdot \pi/p$ is subdivided equidistantly into N_{tilt} overlapping partial segments I_l^k ($1 \leq k \leq N_{\text{tilt}}$) of length L_s , whose centroids differ from one another by at most $L_s \cdot p$ corresponding to the set pitch, such that the following holds for the subsegments I_R^k ($1 \leq k \leq N_{\text{tilt}}$) produced:

$$\text{---} I_R^k = I_l^k; 1 < k < N_{\text{tilt}}$$

$$\text{---} I_R^1 = I_l^1 \cup \{-\alpha_{\max}, -\alpha_{\max}\}$$

$$\text{---} I_R^{N_{\text{tilt}}} = I_l^{N_{\text{tilt}}} \cup \{\alpha_{\max}, \alpha_{\max}\}$$

and the projection datum, belonging to an image voxel, in the detector image D_k is determined by projection in the reconstruction segment I_R^k ($1 \leq k \leq N_{\text{tilt}}$), α_{\max}^v representing the maximum angle reached by the ray through the voxel V . The method as claimed in ~~one of patent claims 1 to 5, characterized in that for the purpose of 3D back projection a spiral segment I_l of length $L_l = [-\alpha_{\max}, +\alpha_{\max}]$ with $\alpha_{\max} = M \cdot \pi/p$ is subdivided equidistantly into N_{tilt} overlapping partial segments I_l^k ($1 \leq k \leq N_{\text{tilt}}$) of length L_s , whose centroids differ from one another by at most $L_s \cdot p$ corresponding to the set pitch, such that the following holds for the subsegments I_R^k ($1 \leq k \leq N_{\text{tilt}}$) produced:~~

Docket No. 32860-000636/US

~~and the projection datum, belonging to an image voxel, in the detector image D_k is determined by projection in the reconstruction segment $IR_k (1 \leq k \leq N_{\text{tilt}})$, φ_{max} representing the maximum angle reached by the ray through the voxel V .~~

8. The method as claimed in ~~one of patent claims 1 to 7, characterized in that~~claim 1, wherein the measured absorption data is weighted as a function of the cosine angle of the ray produced in the direction of the axis of rotation of the detector and radiation source, ~~preferably with the cosine of its cone angle.~~
9. A method as claimed in ~~one of patent claims 1 to 8, characterized in that~~claim 1, wherein the a detector is of planar design and includes ~~having~~ a multiplicity of detector elements ~~that are arranged matricially in rows and columns is used for~~detecting the spiral scanning.
10. A CT unit for scanning an object to be examined, ~~having comprising:~~
 a ray bundle emanating from at least one focus, ~~and having:~~
 -a detector array of planar design ~~with,~~ including a multiplicity of distributed detector elements for detecting the rays of the ray bundle, the at least one focus ~~moving being adapted to move relative to the object to be examined on at least one focal track running around the object to be examined and with,~~ wherein the detector array is situated opposite thereto; and
~~at least means for collecting the detector data, and then filtering and back-projecting the data, wherein the measured and filtered data produced by rays that penetrate at least one voxel are used to reconstruct an absorption value of the at least one voxel, the filtering of the data used for the reconstruction being performed in the direction of a projection of spiral segments that are imaged thereon, produced by the spiral scanning over a prescribed angular range.~~
~~filtering and back projection being provided, and the means for filtering being fastened in such a way that the method as claimed in one of the preceding claims is carried out.~~

11. The CT unit as claimed in claim 10, wherein ~~characterized in that~~ the said means for filtering ~~are~~ is implemented at least partially by at least one programs or or program modules.
12. An imaging method as claimed in claim 1, wherein the scanning of the object is done by rotating ray bundle moving in the direction of the axis of rotation.
13. An imaging method as claimed in claim 12, wherein the projecting of the measured absorption data onto a virtual detector is done at a fulcrum of the rotation.
14. An imaging method as claimed in claim 1, wherein the collecting of the measured data is done by a detector of a planar design.
15. An imaging method as claimed in claim 13, wherein the collecting of the measured data is done by a detector of a planar design.
16. The method as claimed in patent claim 13, wherein the filtering takes place along the intersection line of doubly inclined planes in the virtual detector.
17. The method according to claim 16, wherein the prescribed angular range for a spiral segment of length L_s is $\leq \Pi + 2 * \beta_{max}$.
18. The method according to claim 2, wherein the prescribed angular range for a spiral segment of length L_s is $\leq \Pi + 2 * \beta_{max}$.
19. The method as claimed in claim 2, wherein parallel sorting of the rays for the purpose for forming the virtual detector takes place before the filtering.
20. The method as claimed in claim 19, wherein the prescribed angular range for a spiral segment of length L_s is $\leq 180^\circ$.
21. The method as claimed in claim 13, wherein parallel sorting of the rays for the purpose for forming the virtual detector takes place before the filtering.

22. The method as claimed in claim 21, wherein the prescribed angular range for a spiral segment of length L_s is $\leq 180^\circ$.

23. The method as claimed in claim 13, wherein the segment planes formed at least approximately by the spiral segments have a maximum inclination such that rays for the segment plane in the detector are present inside the measuring field at the ends of the spiral segment considered.

24. The method as claimed in claim 13, wherein, for the purpose of 3D back projection a spiral segment I_1 of length $L_1 = [-\alpha_{\max}, +\alpha_{\max}]$ with $\alpha_{\max} = M \cdot \pi/p$ is subdivided equidistantly into N_{ilt} overlapping partial segments I_1^k ($1 \leq k \leq N_{\text{ilt}}$) of length L_s , whose centroids differ from one another by at most L_s, p corresponding to the set pitch, such that the following holds for the subsegments I_R^k ($1 \leq k \leq N_{\text{ilt}}$) produced:

$$I_R^k = I_1^k; 1 < k < N_{\text{ilt}}$$

$$I_R^1 = I_1^1 \cup \{-\alpha'_{\max}, -\alpha_{\max}\}$$

$$I_R^{N_{\text{ilt}}} = I_1^{N_{\text{ilt}}} \cup \{\alpha_{\max}, \alpha'_{\max}\}$$

and the projection datum, belonging to an image voxel, in the detector image D_k is determined by projection in the reconstruction segment I_R^k ($1 \leq k \leq N_{\text{ilt}}$), α'_{\max} representing the maximum angle reached by the ray through the voxel V .

25. The method as claimed in claim 1, wherein the measured absorption data is weighted as a function of the cosine angle of the ray produced in the direction of the axis of rotation of the detector and radiation source, the cosine angle being a cosine of its cone angle.

26. The method as claimed in claim 13, wherein the measured absorption data is weighted as a function of the cosine angle of the ray produced in the direction of the axis of rotation of the detector and radiation source.
